a telephone line connection;

a speech recogniser for determining or verifying the identity of the speaker of spoken words received via the telephone line connection, by reference to recognition data corresponding to a set of possible speakers; and

means responsive to receipt via the telephone line connection of signals indicating the origin [or destination] of a telephone call to access stored information identifying a subset of the set of speakers and to restrict the recogniser operation to that subset.

1\(\text{\telephone information apparatus comprising:}\)

telephone line connection;

a speech recogniser for recognising spoken words received via the telephone line

connection, by reference to one of a plurality of stored sets of recognition data;

and

means responsive to receipt via the telephone line connection of signals indicating the

original or destination of a telephone call to access stored information

identifying one of the sets of recognition data and to supply this set to the

recogniser;

[A telephone information apparatus as in claim 16 in which] <u>wherein</u> the stored sets correspond to different languages or regional accents.

18. (Amended) A telephone information apparatus comprising:

Reissue of Patent No: 5,940,793

telephone line connection;

a speech recogniser for recognising spoken words received via the telephone line connection, by reference to one of a plurality of stored sets of recognition data;

<u>and</u>

means responsive to receipt via the telephone line connection of signals indicating the original or destination of a telephone call to access stored information identifying one of the sets of recognition data and to supply this set to the recogniser;

[A telephone information apparatus as in claim 16 in which] <u>wherein</u> at least two of the sets correspond to the characteristics of different types of telephone apparatus.

Please add the following new claims.

38. (New) A telephone information apparatus comprising:

a telephone line connection;

a speech recogniser for recognising spoken words received via the telephone line connection, by reference to recognition data representing a set of possible utterances; and

means responsive to receipt via the telephone line connection of signals indicating the

destination of a telephone call to access stored information identifying a subset

of the set of utterances and to restrict the recogniser operation to that subset.

39. (New) Apparatus as in claim 38, in which the apparatus includes: a store containing recognition data for all words of the sets, and

Reissue of Patent No: 5,940,793

the control means is operable to mark in the recognition data store those items of data

therein which correspond to the words not in the subset or those which

correspond to words which are in the subset,

whereby the recognition means may ignore all words so marked or, respectively, not marked.

40. (New) <u>Apparatus as in claim 38, in which: the control means is operable to generate recognition data for each word of the subset.</u>

41. (New) A telephone apparatus comprising:

a telephone line connection;

a speech recogniser for determining or verifying the identity of the speaker of spoken

words received via the telephone line connection, by reference to recognition

data corresponding to a set of possible speakers; and

means responsive to receipt via the telephone line connection of signals indicating the destination of a telephone call to access stored information identifying a subset of the set of speakers and to restrict the recogniser operation to that subset.

42. (New) A telephone information apparatus comprising: telephone line connection;

a speech recogniser for recognising spoken words received via the telephone line

connection, by reference to one of a plurality of stored sets of recognition data;

and

ļ÷

Reissue of Patent No: 5,940,793

means responsive to receipt via the telephone line connection of signals indicating the

destination of a telephone call to access stored information identifying one of the

sets of recognition data and to supply this set to the recogniser.

- 43. (New) A telephone information apparatus as in claim 42 in which the stored sets correspond to different languages or regional accents.
- 44. (New) <u>A telephone information apparatus as in claim 42 in which at least two of</u> the sets correspond to the characteristics of different types of telephone apparatus.

45. (New) A telephone information apparatus as in claim 42 in which one of the sets corresponds to the characteristics of a mobile telephone channel.

46. (New) <u>A method comprising:</u>

recognizing received spoken words by reference to recognition data representing a set of possible utterances; and

responsive to receipt of signals indicating the origin of the spoken words, accessing stored information identifying a subset of the set of utterances and restricting the recognizing operation to that subset.

47. (New) A method comprising:

determining or verifying the identity of the speaker of received spoken words by

reference to recognition data corresponding to a set of possible speakers; and

Reissue of Patent No: 5,940,793

responsive to receipt of signals indicating the origin of the spoken words, accessing stored information identifying a subset of the set of speakers and restricting the recognizing operation to that subset.

48. (New) An apparatus comprising:

a speech recognizer for recognizing received spoken words by reference to recognition

data representing a set of possible utterances; and

means responsive to receipt of signals indicating the origin of the spoken words to

access stored information identifying a subset of the set of utterances and to

49. (New) An apparatus comprising:

restrict the recognizer operation to that subset.

a speech recognizer for determining or verifying the identity of the speaker of received spoken words by reference to recognition data corresponding to a set of possible speakers; and

means responsive to receipt via of signals indicating the origin of said spoken words to

access stored information identifying a subset of the set of speakers and to

restrict the recognizer operation to that subset.
